ABSTRACT

[0043]   Machine-readable media, methods, and apparatus are described for interface remoting. In some embodiments, a server may transmit motion commands to a remote device to update a graphical user interface displayed on the remote device. The motion commands may reference an image object of the remote device and may request the remote device to animate the image object. In some embodiments, the animation specified by the motion commands result in the remote device moving the image object from one location to another location, scaling the image object from a first scale to a second scale, and/or rotating the image object from a first orientation to a second orientation.
